EVR Business Plan — Customer Acquisition Intelligence-as-a-Service

Prepared by: Shai Perednik (Fractional CPTO)

Date: March 8, 2026

Version: 1.0

For: Raymond McSpirit, EVR Advisors

1. Executive Summary

EVR Advisors has built a **proven, deal-closing M&A advisory practice** in the EV charging infrastructure space. The internal playbook - distress signal detection, site enrichment, GTM strategy, and gated deal progression - has already produced results, including a landmark Tesla rip-and-replace partnership.

The opportunity: Every company selling into the EV charging ecosystem - hardware vendors, software platforms, service providers, capital partners - faces the same problem Ray's team solved internally: **finding the right targets, knowing everything about them, and walking into the first meeting fully prepared.**

This business plan proposes **productizing EVR's customer acquisition playbook** into a configurable **tooling + service layer** that any EV industry sales team can use. The product captures each customer's business context (what they sell, who they sell to, their GTM strategy) and delivers a continuous stream of enriched, deal-ready account dossiers tailored to their specific market.

The thesis: *From first touch to deal prep - we accelerate the account team so they show up knowing more than the prospect expects.*

💰 **Revenue model:** White-glove onboarding fee + monthly SaaS subscription + optional advisory services. Three revenue layers that compound as the customer base grows.

2. Market Opportunity

The EV Charging Infrastructure Boom

- **~10,000 DC fast chargers** currently deployed in the US, with federal mandates to scale dramatically
- **$5B NEVI Formula Program** funding corridor buildout nationwide
- **$7.5B+** in combined federal and state incentives for EV infrastructure
- Massive wave of **distressed and underperforming sites** creating M&A activity across the sector

The Ecosystem of Buyers

The EV charging value chain is deep. Every company in it has a sales team that needs intelligence:

Segment	What They Sell	Their Sales Problem
Hardware OEMs	Chargers, connectors, cables, handles, power electronics	Don't know which sites are in buildout phase and actively procuring
Software / Network	OCPP platforms, payment processing, fleet management	Can't identify operators running fragmented, multi-vendor networks
EPC / Installation	Site design, electrical, construction, commissioning	Don't know which sites have permits and funding but no contractor
Service / Maintenance	Uptime SLAs, field service, parts replacement	Can't detect sites with high downtime, bad reviews, aging equipment
Capital / Finance	Project finance, tax equity, lending	Can't efficiently source de-risked, shovel-ready projects

Segment	What They Sell	Their Sales Problem
Utilities	Grid interconnection, demand response, make-ready programs	No visibility into which developers need capacity and where

Every one of these companies is a potential customer. They all need the same thing: *know who to call, why to call them, and what to say - before the first touch.*

Market Sizing

- **US EV charging companies (direct TAM):** ~2,000+ companies across the value chain
- **Average sales team size:** 5-20 reps
- **Willingness to pay for sales intelligence:** Established by ZoomInfo ($500M+ ARR), Apollo, Clearbit, 6sense in adjacent verticals
- **EV-specific gap:** No one is building vertical sales intelligence for this industry

3. The Problem

EV Sales Teams Are Flying Blind

Today, a sales rep at an EV hardware company trying to sell charging connectors has to:

1. **Manually search** DOE databases, news articles, LinkedIn, and industry press to find potential buyers
2. **Guess** which sites are in buildout, which operators are expanding, which projects just got funded
3. **Research each prospect** one by one - who's the decision-maker? What's their current vendor? What's their budget cycle?
4. **Craft a cold outreach** with generic messaging because they don't have enough intel to personalize
5. **Repeat this 50-100 times per quarter** with no compounding intelligence

The result: Low conversion rates, wasted rep time, missed timing on deals, and zero competitive intelligence.

Why This Hasn't Been Solved

- **Horizontal sales tools** (ZoomInfo, Apollo) don't have EV-specific data layers (AFDC, EPA brownfields, utility hosting capacity, NEVI corridors)
- **Industry databases** (AFDC Station Locator, DOE datasets) exist but aren't connected to commercial intent signals
- **The data is fragmented** across federal, state, municipal, and commercial sources - nobody has stitched it together for sales use cases

EVR has already done this stitching for its own deal flow. The product is making it available to everyone else.

4. The Solution

Customer Acquisition Intelligence-as-a-Service

A **configurable intelligence platform** that ingests each customer's business context and delivers continuously updated, deal-ready account dossiers tailored to how they sell.

Sales Acceleration: Before vs. After

```
journey
    title Sales Rep Experience: Manual vs. EVR Platform
    section Without EVR
      Find target companies: 2: Rep
      Research each prospect: 1: Rep
      Identify decision-makers: 2: Rep
      Build a talk track: 2: Rep
      Cold outreach with generic pitch: 1: Rep
      8-16 hrs per prospect: 1: Rep
    section With EVR Platform
      Platform detects matching leads: 5: Rep, Platform
      Enriched dossier auto-delivered: 5: Rep, Platform
      Decision-maker map provided: 5: Rep, Platform
      Personalized talk track generated: 4: Rep, Platform
```

```
Warm intro with full intel: 5: Rep, Platform
15 min per prospect: 5: Rep, Platform
```

How It Works

Step 0 - Customer Onboarding *(The Configuration Layer)*

When a new client signs up, EVR captures their strategic context through a structured intake:

- **What do you sell?** → Product/service catalog
- **Who do you sell to?** → Target personas (procurement managers, fleet operators, site developers, C-suite)
- **What's your GTM motion?** → Direct sales, channel, field reps, inside sales, partner-led
- **What's your ICP?** → Company size, geography, vertical (transit, retail, fleet, highway corridor)
- **Short-term goals** → "Close 15 new CPO accounts in Q2"
- **Long-term goals** → "Become the preferred hardware supplier for Tesla-certified installers"

This onboarding becomes the **lens** through which the entire intelligence engine operates. Every signal, every enrichment, every playbook is filtered through the client's specific business context.

> 🔑 **Key insight:** The data layer is shared across all customers. The intelligence layer is personalized per customer's onboarding inputs. This is what makes the platform scalable while still feeling bespoke.

Step 1 - Lead Capture & Signal Detection *(Stage 1: Strategic Fit)*

The platform continuously monitors **20+ structured and unstructured data sources** and flags leads that match the customer's configured ICP:

Structured Data Sources:

- DOE / AFDC - Station locations, connector types, network operators, utilization
- EPA ACRES & Envirofacts - Brownfield sites, remediation status, institutional controls
- State Voluntary Cleanup Programs - CA EnviroStor, NY DEC, TX TCEQ
- ATTOM / Reonomy - Property distress signals (tax liens, foreclosures, ownership)
- Utility hosting capacity - PG&E GRIP, SCE DRPEP, interconnection queues
- Permitting & zoning - Municipal open data, Zoneomics
- NEVI corridor data - Funding awards, designated corridors, needed locations

Unstructured Signal Sources:

- Google/Yelp reviews - Sentiment analysis for distress indicators
- Social media - Operator announcements, hiring signals, executive changes
- News & press releases - Funding announcements, partnership deals, expansion plans
- Job postings - Companies hiring field techs = expanding; hiring bankruptcy counsel = distressed

The signals change based on what the customer sells:

Customer Type	Buying Signals We Detect
Hardware vendor	Sites newly permitted, recently funded, in buildout phase (they need to buy hardware NOW)
Service / maintenance	Sites with bad reviews, high downtime, aging equipment (distress = their buying signal)
Software platform	Operators running 5+ sites on fragmented systems (consolidation = their opportunity)
Capital provider	Shovel-ready sites with permits + grid capacity but stalled funding (their sweet spot)

Step 2 - Enrichment & GTM Playbook *(Stage 2: Qualification & Deal Prep)*

For every flagged lead, the platform auto-generates an **enriched account dossier** configured to the customer's personas and selling motion:

Account Dossier Contents:

- **Company profile** - What they do, size, stage, geography, recent activity
- **Decision-maker map** - Who to contact, title, LinkedIn, email, phone
- **Competitive intel** - Current vendors, contract timing, switching signals
- **Buying signals** - Why NOW is the right time (funding event, expansion, distress)
- **Recommended approach** - Personalized talk track based on the customer's product and the prospect's situation
- **Supporting evidence** - Data provenance showing exactly which signals triggered this recommendation

Example output for the hardware vendor client:

📄 **Account Dossier: GreenCharge Networks**
Signal: 8 new NEVI-funded sites permitted in Ohio corridor (Q1 2026). Currently using BTC Power hardware on 3 existing sites - 2 of which show >15% downtime in AFDC data.
Decision-maker: Sarah Chen, VP Procurement (LinkedIn)
Approach: Lead with the reliability angle - their current vendor's downtime is costing them NEVI compliance penalties. Your product's uptime SLA directly solves their funding risk.
Timing: Procurement for the 8 new sites likely in next 60 days based on construction permit timeline.
Evidence: [AFDC utilization data] [Ohio DOT permit records] [NEVI award announcement]

5. EVR's Proprietary Advantage

The 8-Stage Gated M&A Framework

EVR's institutional knowledge - codified from years of Ray and Kenny's deal-making experience - is the engine behind the intelligence layer:

1. **Strategic Fit** - Distress detected, opportunity flagged
2. **Technical Convertibility** - Technical validation (e.g., Tesla greenlight, hardware compatibility)
3. **Physical Feasibility** - Site-level engineering check
4. **Economic Survivability** - Financial model validates
5. **Control & Structure** - Acquisition/partnership structure defined
6. **Capital Fit** - Funding aligned
7. **Execution** - Build / implement
8. **Monetization** - Hold, sell, or operate

For the productized service, Stages 1 and 2 are the core. The platform automates everything from first signal detection through deal-ready prep - stopping just short of the deal memo. This is the highest-leverage, most repeatable part of the process.

The remaining stages (3-8) become **upsell advisory services** for customers who want EVR's team to help close.

Why This Is Defensible

1. **Domain expertise codified as software** - Ray and Kenny's heuristics, pattern recognition, and deal instincts are baked into the signal detection and scoring algorithms
2. **Proprietary data synthesis** - No one else has stitched together AFDC + EPA + ATTOM + utility + municipal data into a single EV-specific intelligence layer
3. **Network effects** - Every customer's usage improves the model (which signals actually lead to closed deals)
4. **Switching costs** - Customers configure their entire GTM strategy into the platform; leaving means rebuilding from scratch

6. Business Model

Revenue Flywheel

```

```

Three Revenue Layers

Revenue Layer	Description	Pricing	Timing
1. Onboarding & Configuration	White-glove setup: EVR captures the client's business plan, GTM, personas, goals and configures the intelligence engine	$5,000 - $15,000 one-time	Day 1
2. SaaS Platform	Continuous lead detection, enrichment, and dossier generation. Monthly dashboard access with configurable alerts	$2,000 - $5,000/month per seat tier	Recurring

Revenue Layer	Description	Pricing	Timing
3. Advisory Services	EVR's team helps interpret intel, coaches account teams, provides GTM strategy consulting, assists on deal progression (Stages 3-8)	$300/hour or $10,000/month retainer	Upsell

Unit Economics

Metric	Value
Cost per lead analysis (data + LLM)	~$1.15
Revenue per dossier (blended)	$50 - $200
Gross margin per analysis	95%+
Target monthly SaaS ARPU	$3,500
Onboarding revenue per customer	$10,000 (avg)
CAC (Ray's network = zero-cost top of funnel)	Low - estimated $2,000-5,000
Target LTV:CAC ratio	>10:1

7. Traction & Proof Points

What's Already Been Built and Proven

1. **Tesla rip-and-replace deal closed** - Ray's manual deal engine (Airtable + Pipedrive) sourced a distressed site and matched it with Tesla for acquisition and conversion. This validates the entire signal → enrichment → deal flow pipeline.
2. **8-stage gated framework operational** - EVR's M&A process is codified and actively used across multiple live deals.
3. **Data source inventory completed** - Deep research across 20+ federal, state, and commercial APIs has been conducted and documented. Signal-to-data-source mapping is defined.
4. **Architecture designed** - The 4-layer system architecture (Edge → EVR OS → DataMind → Extensions) is documented and ready for build.

5. **Landing pages shipped** - Persona-specific demos (PE, CRO, HR) for the adjacent Org Mapper product demonstrate the team's ability to ship investor-ready collateral.
6. **Client pipeline active** - Ray has active deals in Pipedrive and an established network of EV industry contacts ready to be first customers.

8. Go-to-Market Strategy

Phase 1: Founder-Led Sales *(Q1-Q2 2026)*

Channel: Ray's existing network

Motion: Every M&A deal Ray closes is a live demo of the platform's capabilities. The pitch writes itself: *"See how we found this deal? We can set up the same system for your sales team."*

First 3 customers:

- Hardware vendor (charging handles, cords, connectors) - already identified
- EPC / installation company in Ray's network
- Capital partner looking for deal flow

Phase 2: Repeatble Sales *(Q3-Q4 2026)*

Channel: Industry events, partnerships, referrals

Motion: Case studies from Phase 1 customers → conference talks → inbound

Target: 10-15 paying customers by end of Year 1

Phase 3: Scale *(Year 2)*

Channel: Inside sales team + partner channel

Motion: Self-serve onboarding for smaller accounts, enterprise sales for large CPOs/OEMs

Target: 50+ customers, expand beyond EV charging into adjacent energy infrastructure

GTM Phasing Timeline

    style P2 fill:#e6ffe6,stroke:#4a9d4a
    style P3 fill:#fff0e6,stroke:#d9944a
```

Pricing Strategy

Land: $2,000/month starter tier (limited leads, basic enrichment)

Expand: $5,000/month pro tier (unlimited leads, full dossiers, competitive intel)

Upsell: Advisory retainer ($10,000/month) for hands-on GTM coaching and deal support

9. Technology & Architecture

    style Agents fill:#fff0e6,stroke:#d9944a
    style Output fill:#f0f0f0,stroke:#888
```

Key Architectural Principles

- **Shared data, personalized intelligence** - One data ingestion pipeline serves all customers; the configuration layer personalizes the output

- **Provenance-first** - Every recommendation traces back to source data (the "Trust Layer" that differentiates from generic AI tools)
- **Modular agents** - Scout, Historian, Analyst, Auditor agents can be independently upgraded or replaced
- **Multi-tenant by design** - Each customer's configuration, leads, and dossiers are isolated

Tech Stack

- **Orchestration:** Celery + Redis (async task queue)
- **Data store:** PostgreSQL with provenance tracking schema
- **LLM layer:** GPT-4 for enrichment and playbook generation (adapter pattern for provider flexibility)
- **Scraping:** Playwright + Apify fallback for LinkedIn and unstructured sources
- **APIs:** Direct integrations with AFDC, EPA Envirofacts, ATTOM, Reonomy, utility portals
- **Frontend:** React dashboard (Phase 2)

10. Team

Name	Role	Focus
Raymond McSpirit	CEO / Head of Sales	Deal origination, client relationships, industry expertise, GTM strategy. The domain expert whose playbook IS the product.
Kenny	Head of Sourcing	Lead research, qualification heuristics, pattern recognition. The "rules engine" that powers signal detection.
Dustin	Product / Infrastructure Lead	EBR infrastructure, operational tools, capital partner interface. Owns the execution side (Stages 3-8).
Shai Perednik	Fractional CPTO	Architecture, agentic systems, data pipeline design, product strategy. 100hrs/month dedicated to platform build, scaling to full-time as customer base grows.

Key Hire (Year 1)

- **1-2 Full-stack developers** - Build and maintain the data pipeline, dashboard, and customer-facing platform

11. Financial Projections

Year 1 - Build & Validate

Quarter	Milestone	Revenue	Customers
Q1	Internal tooling MVP; validate on EVR's own deals	Advisory only (~$30k)	0 (internal use)
Q2	First external customer onboarded; beta launch	$40k (advisory + 1 onboarding)	1-2 beta
Q3	3-5 paying customers; product-market fit signals	$75k (onboarding + MRR ramp)	3-5
Q4	10+ customers; case studies published; conference presence	$120k (MRR ~$30k/mo)	10-15
Year 1 Total		**~$265k**	**10-15**

Year 2 - Scale

Metric	Target
Customers	50+
MRR	$150k - $250k/mo
ARR	$1.8M - $3M
Gross margin	80%+
Team size	8-12

Cost Structure (Year 1)

Line Item	Monthly	Annual
Fractional CPTO	$30,000 - $48,000	$360k - $576k
Developer(s)	$10,000 - $15,000	$120k - $180k

Line Item	Monthly	Annual
Data APIs & infrastructure	$1,000 - $2,000	$12k - $24k
LLM costs (at scale)	$500 - $1,500	$6k - $18k
Total Year 1 Costs	**$41,500 - $66,500**	**$498k - $798k**

It's expected this project will require 100 hours/month to start (100 hrs = $30k/mo) and would ramp up as clients are onboarded in Year 1 into Year 2, scaling toward full-time at 160 hrs/month ($48k/mo).

12. The Ask

Capital Required

$498k - $798k for Year 1 (~$41,500 - $66,500/month)

This reflects the true cost of building a production-grade, multi-tenant intelligence platform with 20+ data source integrations, agentic processing, and white-glove customer onboarding.

Use of Funds

- **69%** - Engineering (CPTO + developer): Architecture, platform build, data pipeline, customer configurations
- **16%** - Data & infrastructure: API subscriptions, hosting, LLM costs
- **15%** - GTM: Sales collateral, conference attendance, first customer acquisition

Phased Investment Model

The capital requirement scales with the business. A phased approach reduces upfront risk:

Phase	Duration	Focus	Monthly Burn	Total
Phase 1: Internal MVP	Months 1-3	Platform build, data pipeline, architecture	~$43,000	$129,000
Phase 2: First customers	Months 4-6	Customer onboarding,	~$46,000	$138,000

Phase	Duration	Focus	Monthly Burn	Total
		configuration layer, iteration		
Phase 3: Scale	Months 7-12	Multi-tenant scaling, dashboard, expanded integrations	~$48,500 - $66,500	$291k - $399k

💡 **Self-funding trajectory:** By Month 6, with 3-5 paying customers at $3,500/mo ARPU + onboarding fees, the platform generates $17,500 - $27,500/month in recurring revenue. By Month 9-12, customer revenue should approach or exceed the monthly burn rate, reducing dependency on external capital.

Key Milestones

- **Month 2:** Internal MVP running on EVR's own deal flow
- **Month 4:** First external customer onboarded and generating dossiers
- **Month 6:** 3-5 paying customers with measurable deal velocity improvement
- **Month 9:** $20k+ MRR; case studies published
- **Month 12:** 10-15 customers; $30k+ MRR; approaching self-sustaining or ready for seed round

Success Metrics

1. **Deal velocity:** 3x improvement in customer's time from lead identification to first qualified meeting
2. **Pipeline generation:** 5x more qualified leads per rep per month vs. manual research
3. **Win rate lift:** 20%+ improvement in close rates due to superior pre-call intelligence

4. **Customer retention:** 90%+ monthly retention (measured by continued platform usage)

Appendix A: Competitive Landscape

Competitor	What They Do	Why We Win
ZoomInfo / Apollo	Horizontal B2B sales intelligence	No EV-specific data layers (AFDC, EPA, utility, NEVI). Generic firmographics don't surface charging infrastructure signals.
Industry databases (AFDC, PlugShare)	Raw infrastructure data	Data without intelligence. No enrichment, no GTM playbooks, no personalization to customer's business.
Management consultants	Custom research engagements	$50k+ per engagement, weeks to deliver. We deliver continuously at 1/100th the cost.
In-house research	Sales reps doing manual research	8-16 hours per prospect vs. <15 minutes. Doesn't scale, doesn't compound.

Appendix B: First Customer Example

Customer: EV hardware company selling charging handles, cords, and connectors

Onboarding inputs:

- **Products:** CHAdeMO and CCS connectors, charging cables rated 150kW-350kW, mounting hardware
- **ICP:** CPOs with 5+ sites, site developers with active NEVI awards, OEM-certified installers
- **Personas:** VP Procurement, Director of Site Development, Fleet Operations Manager
- **GTM:** Direct field sales (West Coast) + distributor channel (rest of US)
- **Short-term goal:** 15 new accounts in Q2
- **Long-term goal:** Preferred vendor status with 3 major CPOs

What the platform delivers:

- Weekly feed of CPOs that just received NEVI funding (they'll need hardware in 60-90 days)
- Alerts when existing charger operators show downtime spikes (replacement hardware opportunity)
- Decision-maker contact info at each target
- Recommended approach: "Lead with your 350kW cable's uptime rating vs. their current vendor's failure rate"
- Evidence: AFDC utilization data + NEVI award records + permit filings

Result: Rep walks into the first call knowing the prospect just got funded, knows their current hardware vendor, knows their downtime problem, and has a specific talk track. That's not a cold call - that's a warm introduction.

Appendix C: Data Sources Inventory

Federal:

- DOE AFDC Station Locator API
- EPA ACRES Brownfields Properties
- EPA Envirofacts REST API
- FHWA Alternative Fuel Corridors
- LBNL Queued Up Dataset (interconnection)

State:

- CA DTSC EnviroStor
- NY DEC Environmental Remediation
- TX TCEQ Central Registry
- State NEVI corridor designations

Commercial:

- ATTOM Property Data API (distress signals)
- Reonomy Property API (ownership, zoning)

- First American DataTree (title, liens)

Utility:

- PG&E GRIP (hosting capacity)
- SCE DRPEP (integration capacity)
- interconnection.fyi (queue tracking)

Municipal:

- City open data portals (zoning, permits)
- Zoneomics API (normalized zoning)

Unstructured:

- Google/Yelp reviews (sentiment)
- LinkedIn (hiring signals)
- News / press releases (funding, partnerships)
- Job postings (expansion/contraction signals)
